ApplyFlow Startup Overview

Non-confidential introduction | November 2026

Product

ApplyFlow helps international students prepare university applications from one reusable profile. Students manage their details and documents, find programs, and review supported applications. Consulting agencies can coordinate preparation and see case progress with applicant permission.

Development stage

The working prototype includes student, agency and admin functions. Controlled tests cover core preparation and review steps. A live public university portal test reached a program-selection step. The first major target is 100 independently verified workflows, starting with a small, institution-approved pilot group.

Customers and revenue

The first buyers are education consulting agencies handling repeated international intakes. ApplyFlow plans to test paid pilots and a subscription whose price reflects active cases. Pilot results will measure staff time per case, manual corrections and successful completion.

Support sought

ApplyFlow is seeking eligible cloud infrastructure and AI development resources, engineering mentorship, and approximately USD 25,000 in proposed milestone-based funding for appropriate grant or venture discussions. The funds would support workflow verification, security, product development and agency pilot evaluation.

Founder

Jaloliddin Botirov is an independent software developer based in Tashkent, Uzbekistan. His background includes Java backend development, full-stack development, software quality assurance and automation testing. A short demo using synthetic data is available to prepare for an introductory conversation.
